

ELECTRONIC DATA INTERCHANGE (EDI)

Delivering greater collaboration across the supply chain

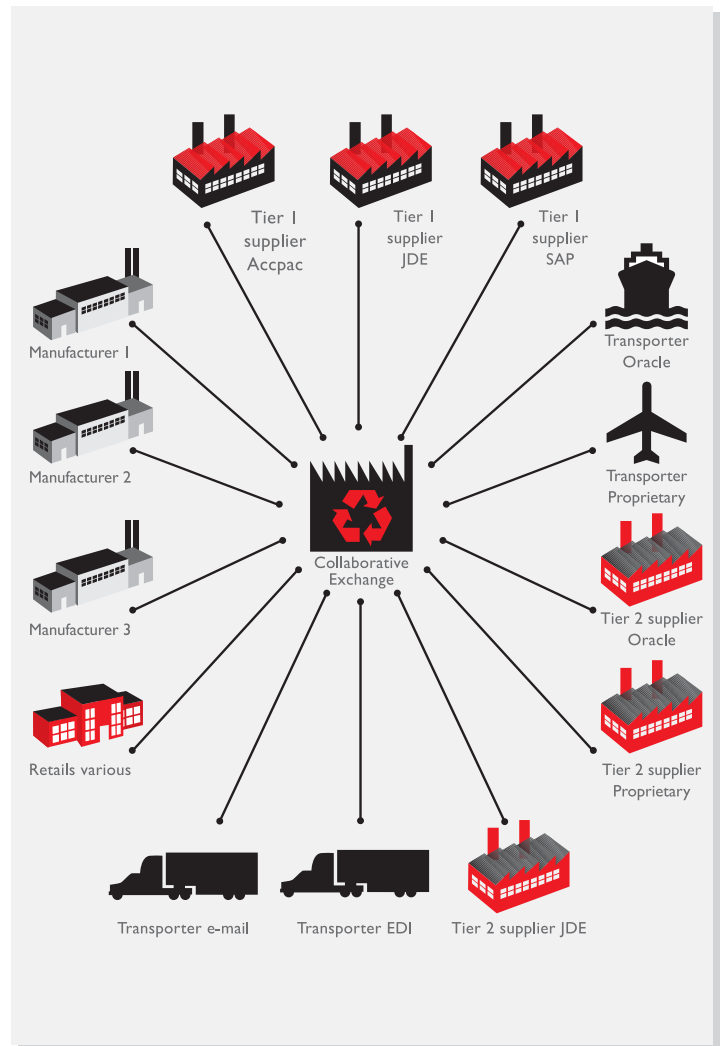

Collaborative Xchange provides a Business to Business EDI platform that facilitates real-time integration between disparate computer systems. Using the Internet as a communication medium and CX as a central hub, a customer can communicate to any other trading partner using any desired protocol. CX will transform this data, according to predetermined standards and agreements, and forward this data to the destined partner.

Works across all standards

CX complies with all global EDI standards as well as any bespoke format that a customer may already have in place. This facilitates the speedy implementation of integrations across multiple supply chains and industry verticals. Using real-time “manage by exception” monitoring tools, CX will manage all your integration requirements 24x7. Any recognised industry standard protocol can be used to communicate with CX including FTP, SMTP, OFTP, MQ Series and HTTP/S.

A secure environment to transact

CX will store key attributes of the data you submit and using this data connect your entire trading community for complete end-to-end supply chain visibility. CX maintains this service to its customers via a production and remote DR hosting environment located in Johannesburg. Both environments are directly connected to the backbone of the South African Internet and protected by best of breed security devices.
